

WHY ACME CYLINDER HEADS DO NOT FAIL:

- We pressure test every single heads water ways to 80 to 100 psi and not random one in 10 or 20 or batch test.

- We are the only company in that pressure test head oil galleries to 100 psi this is as or if not more important that water galleries as the oil is of a high pressure and hotter.
- We are the only one company that vacuum test all valve seat and blue the valve to seat to check correct position of valve face to seat.

- We grind machine our head face surface to a finish and straightness that no one else does, others may look ok until you measure them and they are all ways 0.05 mm out or more. The final line bore process on world class Berco B6 line bore machine.
- Every single head goes through 24 points of rigorous quality check process to maintain the OEM standard.
